# APPLICATION INSTRUCTIONS

## SUBSTRATE QUALITY

The substrate surface must be uniform, smooth and free of any sharp protrusions or burrs, etc.

The supporting layer must be compatible to the membrane, solvent resistant, clean, dry and free of grease and dust. Metal sheets must be degreased with Sarnafil® Cleaner before adhesive is applied.

## APPLICATION

Installation works must be carried out only by Sika instructed contractors for roofing.

Installation of some ancillary products, e.g. contact adhesives / cleaners is limited to temperatures above +5 °C. Please observe information given by Product Data Sheets.

Special measures may be compulsory for installation below +5 °C ambient temperature due to safety requirements in accordance with national regulations.

## APPLICATION METHOD / TOOLS

### Installation procedure:

According to the valid installation instructions of manufacturer for Sarnafil® TG 66-types system for ballasted or fully adhered roofs.

### Fixing Method:

Loosely laid and covered with ballast. Mechanical fixing at the roof perimeter with Sarnabar including Sarnafil® T Welding Cord is obligatory to keep membrane in place. Roof waterproofing membrane is installed by loose laid and covered with ballast according to local wind load situation.

Adhered roof junction areas and flashings: Sarnafil® TG 66-18 is adhered to substrate layers such as reinforced concrete rendering, timber panels, metal sheets, etc. by contact adhesive Sarnacol® T 660. Seam overlaps are welded by hot air.

### Welding Method:

Before welding the seams are prepared with Sarnafil® T Prep. Overlap seams are welded by electric hot air welding equipment, such as manual hot air welding machines and pressure rollers or automatic hot air welding machines with controlled hot air temperature.

### Recommended type of equipment:

- Leister Triac PID for manual welding
  - Sarnamatic 661<sup>plus</sup> / 681 for automatic welding
- Welding parameters including temperature, machine speed, air flow, pressure and machine settings must be evaluated, adapted and checked on site according to the type of equipment and the climatic situation prior to welding. The effective width of welded overlaps by hot air should be minimum 20 mm.

The seams must be mechanically tested with screw driver to ensure the integrity / completion of the weld. Any imperfections must be rectified by hot air welding.
